

## **IT Infrastructure Virtualization and Server Consolidation**

The server consolidation project virtualized the entire enterprise server infrastructure, reducing the number of physical servers from 60 down to 12 blade servers running VMware VSphere. Additionally, a virtual desktop infrastructure environment was established to provide more flexibility in deploying and maintaining end-user workstations at sites with limited bandwidth. The new environment included a VEEAM backup solution that provides a seamless disaster recovery system and real-time backup and restore capability, server replication, and redundancy of the server farm.
